

Remediation Services

WSP's greatest strength is our remediation of impacted sites. We are successful because our engineers select the right technology based on site conditions and we have done it right thousands of times at locations across the country. Our experienced engineers know that successful cleanup requires site-specific solutions – that's why, depending on the problem at hand, we offer both tried and true remedial solutions and innovative but practical approaches. More importantly, no active mechanical remediation system is effective unless it is running. We have the highest run times in the business. Our remedial solutions are designed to close sites with minimal disruption to business operations.

Our solutions include:

- Design, installation, operation and maintenance
- Pilot testing
- Construction and installation
- Performance monitoring
- Fate and transport modeling
- Soil shredding
- *Ex-situ* treatment
- *In-situ* treatment
- Injection
- Landfarming
- Monitored natural attenuation
