

How our kit-of-parts approach
is transforming construction

EXPECT DIFFERENT

Why hasn't construction
achieved the same efficiency,
quality control, health & safety,
and certainty as manufacturing?

IT'S TIME FOR CHANGE

WSP's kit-of-parts approach combines advanced manufacturing, digital design and program-level thinking to reshape the process of designing and making a building, enabling more efficient construction methodologies by shifting more effort from the site to the factory. These will contribute to improvements in quality and safety outcomes.

It's flexible, creative and market-leading, and it's already delivering tangible results for our clients.

We're applying it on projects around the world to help accelerate delivery, increase productivity, manage costs and achieve improvements in quality and sustainability.

Read on to find out more.

RETHINK CONSTRUCTION

because the future
demands better

At WSP, we believe the kit-of-parts is the future of construction, and we're already making it a reality.

"Design for Manufacture and Assembly requires a completely different approach to designing for construction. We are leveraging insights from our latest projects and programs, and applying new skill-sets and game-changing digital tools to deliver the next generation of building like products."

Dale Sinclair, Head of Digital Innovation, WSP, UK

Traditionally, designing a building has meant starting from scratch every time, making hundreds of thousands of tiny decisions. These choices are often ones the project team have made before.

Construction can be just as inefficient: millions of components and tonnes of materials delivered to site by hundreds of trucks and put together by thousands of people.

We can't afford to keep wasting time and resources.

The built environment is responsible for one-third of global carbon emissions, and the world is on a journey to net zero. Buildings are becoming more complex as we strive for better performance, less consumption and quicker delivery. At the same time, there are fewer workers entering the construction industry, and many new skills for them to learn.

The race is on to build the infrastructure of the green transition and the fourth Industrial Revolution, which requires resilient communities for growing populations. All of this is possible, but traditional design and construction processes won't deliver the change we need.

With our kit-of-parts approach, we are helping reshape how buildings are designed and constructed. This will lead to major benefits for clients, in terms of time, cost, quality, sustainability, and economic and social value.

By harnessing the power of digital tools and industrialized construction, our expert teams are simplifying decision-making, streamlining design, moving from construction to manufacturing, and applying learning in real time. This shifts the focus from project to program and onwards to product approaches.

REDEFINE POTENTIAL

a new way to design and construct buildings

Our kit-of-parts approach enables us to combine customized offsite manufacturing solutions within a Design for Manufacturing and Assembly (DfMA) workflow, and to scale up the benefits across programs and multiple projects.

We determine the optimal balance of innovative construction approaches and identify the most effective delivery approach. We break buildings down into larger components that can be precision-manufactured and transported to site for efficient assembly.

Capturing data about both the components and the decision-making process enables ongoing refinement within and between projects. We can also set portfolio-level product customized to deliver client-specific goals.

TRANSFORMING THE PROCESS

Although our kit-of-parts approach can transform the outcomes for a single project, it is about more than that. Kit-of-parts is aligned to our vision for the future of construction, where every project yields exciting insights, knowledge and experiences. This work with our Digital Innovation team also develops the new skills and digital tools needed to take on future challenges.

HOW DOES OUR KIT-OF-PARTS APPROACH WORK?

We are rethinking design from the ground up, based on six key principles.

OPTIMIZE

Rigorous optioneering and analysis at concept stage identifies the optimal offsite manufacturing technologies and balances them with the most appropriate onsite approaches.

OUTCOME – Design is tailored to offsite manufacturing early in the process; the right onsite methods are integrated into the bespoke solution.

DECIDE

Currently decisions are made intuitively or by groups of stakeholders. With our kit-of-parts approach decisions are captured and recorded in the project database as part of the design process. They are then able to be mobilized for reuse.

OUTCOME – Effort is not wasted on making the same decisions repeatedly. Greater scrutiny can be placed on program decisions and change control, while project decisions focus on specific challenges and design solutions.

DESIGN

Creating offsite manufacture-ready content and aligning it to replicable decisions, simplifying the design process. Catalogues and configurators streamline manufacturing processes and generate economies of scale around product approaches.

OUTCOME – Subsequent project design, manufacture and assembly timescales become faster; reduced decision-making allows for a laser focus on project-specific challenges.

MANUFACTURE

The shift from construction to manufacturing is a significant transformation. The kit-of-parts approach makes the transition as smooth as possible.

OUTCOME – Industrialized construction is faster, cleaner, safer and more efficient. Quality is improved, waste is reduced and economies of scale can be mobilized. Clients can change the way they work at their own pace.

CAPTURE

Information on everything from decision-making to sub-assembly designs is captured in the appropriate digital technology; emphasis is on mobilizing DfMA initiatives at scale.

OUTCOME – The substantial information that exists at the end of every project is set up to be exploited and reused on future projects.

REPEAT

Project one determines a stable way of working, aligned to client-specific program goals, catalogues and decisions for future work. For one-off projects, clients can draw on the knowledge, skills and real-time insights from other kit-of-parts projects.

OUTCOME – A program-level approach reaps the benefits of faster, streamlined DfMA approaches linked to new procurement and manufacturing models. Creativity is empowered at the project level.

FROM PROJECTS TO PROGRAMS, POLICY AND BEYOND

Our kit-of-parts approach accelerates delivery from the first project, but the full benefits become clear at the program level. By streamlining decision-making, enabling mass customization, and shifting construction from site to factory, it can support more consistent delivery across programs, more informed decision-making and meaningful improvements for clients.

PROJECTS

A redefined project process supports the selection of the most efficient offsite manufacturing solutions, and the fabrication of large sub-assemblies to help accelerate delivery.

PROGRAMS

Once created, the kit-of-parts uses catalogues and configurators to balance reuse and repetition with customization. The inherent data capture and standardization opens up the potential for knowledge databases and an AI-driven decision engine to bring greater focus to decision-making at a project and program level.

PRODUCT

Shifting to product approaches enables repeat buildings to contain a high proportion of fabrication ready, offsite manufactured elements to help speed up delivery, reduce costs and make them more predictable.

BUILD IMPACT
BUILD IMPACT
BUILD IMPACT
BUILD IMPACT
BUILD IMPACT
BUILD IMPACT
BUILD IMPACT
BUILD IMPACT
BUILD IMPACT

Our kit-of-parts approach can make design for manufacture more efficient, removing friction and improving productivity.

It can deliver tangible benefits from the first project onwards, and these benefits are amplified at a program level.

It also creates a platform through which emerging innovations in modelling, analysis, materials and manufacturing methods can be readily deployed, and improved in real time to drive further efficiencies.

WHAT BENEFITS CAN A KIT-OF-PARTS APPROACH BRING?

01

FASTER DELIVERY

The first project is designed within standard timescales with the aim of delivering faster on site. Subsequent projects can become much quicker to design and assemble – using a kit-of-parts with fabrication-ready components, models and workflow. Feedback can be used to refine the process over time, with the potential for faster delivery and reduced time to market compared with traditional approaches.

By setting key policies at a program level, we streamline the design process and reduce the number of iterations required.

Detailed information on fabrication, logistics and sequencing is produced at the early design stage, enabling input from manufacturers, the assemblers and logistics experts, reducing duplicated efforts, and cutting lead-in times and handover periods.

Offsite manufacturing with rapid onsite assembly can reduce program risks.

02

MANAGING COSTS

We determine the optimum kit-of-parts at an early stage, from a range of innovative industrialized approaches. This means designs are tailored to cost-effective manufacturing processes with standardization and repetition unlocking the savings offered by offsite manufacturing.

Fixing detailed designs at a much earlier stage enables program-level procurement and more robust negotiations.

Taking a program-level approach unlocks economies of scale, potentially reducing the cost of each subsequent project.

By relocating construction work from dispersed sites to strategically located factories, we can take advantage of local labour markets, offer better working conditions, and avoid paying premiums for scarcity, travel or high-risk environments.

03

HIGHER QUALITY

Building components are precision-made in a controlled factory environment and assembled onsite in line with defined manufacturing tolerances.

By setting common rules and standards across a program and streamlining routine decision-making, project teams can focus on adding value and improving the process.

Manufacturing delivers higher standards of health and safety, with improved lighting, access and dust extraction, providing a better quality of life for locally based workers.

04

IMPROVED SUSTAINABILITY

Sustainability goals can be set at a program level, with targets for continuous improvement.

Designs can be optimized to use materials efficiently, and to reduce embodied and operational carbon.

Shifting elements of construction from site to factory can contribute to reducing waste and improving resource efficiency and may help lower transport-related emissions in certain project contexts.

OUR APPROACH IN ACTION

We are applying our kit-of-parts approach in the aviation, rail, industrial, life sciences, defence, data centre and residential sectors.

Many of our kit-of-parts projects are confidential, but this graph illustrates the range of new skill-sets and digital tools that we are creating.

ACCELERATE AIRPORT EXPANSION

We are working with contractor Mace at Manchester Airport to deliver the nodes and fixed links for a new pier that will add 13 new gates, significantly expanding capacity.

Taking a kit-of-parts approach, we designed a node that can be constructed from just 64 sub-assemblies, instead of thousands of individual components, which would all have to be transported individually to site. By rationalizing the design into a smaller number of much larger assemblies, we reduced the construction time onsite, the pollution and emissions associated with deliveries, and the risks of working in a live airport environment.

Our digital innovation specialists have been working with the Environment Agency in England to make its depot program faster, more cost-effective, and more predictable.

By applying customization at scale, and taking a program-level approach to sustainability and offsite manufacturing, we have reduced the projected time and enabled our client to take advantage of innovative procurement and fabrication methods. After the kit-of-parts was developed for the first depot, subsequent projects required fewer documents. We are continuing to drive efficiencies by incorporating real-time feedback as the program progresses.

WSP is one of the world's leading engineering, science and infrastructure solutions firms, uniting its multidisciplinary expertise to shape communities to advance humanity. From local beginnings to a globe-spanning presence today, WSP operates in over 50 countries and employs approximately 83,000 professionals, known as Visioneers. Together they pioneer solutions and deliver innovative projects in the transportation, infrastructure, environment, building, energy, water, and mining and metals sectors.
